**ATOMIC IONIZATION AT ANNIHILATION OF POSITRONS EMITTED AT  $\beta^+$ -DECAY**

Atomic ionization at annihilation of positron with another electron of daughter's atom at  $\beta^+$ -decay is studied. Processes of the different atomic shells ionization at annihilation of positron, emitted at  $\beta^+$ -decay, with K-electron of daughter's atom are considered. The relative contribution of probabilities of these processes in case of electron emission from different ns-shells ( $n = 1, 2, 3, 4$ ) is found. It is shown that the most probable process is related to emission of other K-electron.

*Keywords:* annihilation,  $\beta^+$ -decay, atomic shell, K-electron, L, M, N-atomic shells.
